

Analysis of Curriculum Alignment with Learning For Justice Standards

Course Title: Prototyping & Innovation

Curriculum Designer: Blake Gideon

The newly designed curriculum for the Prototyping & Innovation course aligns well with the Learning for Justice Standards, as it emphasizes diversity, justice, and social responsibility during the course. Firstly, the exploration of futurism and the discussion of technological advancements prompt students to recognize and describe unfairness and injustice at different societal levels, as indicated by Justice 12: JU.9-12.12. By engaging students in critical thinking about the ethical, social, and economic impacts of technology, the curriculum encourages them to evaluate and predict the effects of computing innovations, which corresponds with CSTA Standards regarding the impacts of computing (3A-IC-24, 3B-IC-27). This approach equips students with the necessary skills to become thoughtful, socially aware innovators capable of developing solutions that address real-world problems.

Moreover, the curriculum fosters a culture of inquiry, creativity, and collaboration, which are fundamental aspects of the Learning for Justice Standards. Students are encouraged to explore questions, present their ideas effectively, and synthesize information from multiple sources to devise innovative solutions. Through activities such as creating prototypes, analyzing societal impacts, and envisioning the future, students develop critical thinking skills and an understanding of the complexities of technological innovation. Overall, Prototyping & Innovation offers a comprehensive learning experience that not only prepares students for future technological challenges but also instills in them a sense of social responsibility and awareness of justice issues in a rapidly evolving world.
